

Introduction to Computer Science and Programming in Python (MIT)

N. Ceylan

April 29, 2019

1 Lecture 1: What is Computation?

- **int** Integers
- **float** Real numbers
- **bool** Boolean
- **NoneType** Special none value
- **type()** can use `type()` to see type of an object.

2 Branching and Iteration

3 String Manipulation, Guess and Check, Approximations, Bisection

- `>>> s = "abc"`
- `>>> len(s)`
- `>>> 3`

4 Decomposition, Abstraction, and Functions

in programming, divide code into modules:

- are self-contained
- used to break up code
- intended to be reusable

- keep code organized
- keep code coherent

5 Tuples, Lists, Aliasing, Mutability, and Cloning

5.1 Tuples

- Immutable
- `>>> tuple = ()`

5.2 List

hot is an alias for warm - changing one changes another.
`append()` has a side effect.

- `>>> a = 1`
- `>>> b = a`
- `>>> print(a)`
- `>>> print(b)`
- `>>>`
- `>>> warm = ["red", "yellow", "orange"]`
- `>>> hot = warm`
- `>>> hot.append("pink")`
- `>>> print(hot)`
- `>>> print(warm)`
- `>>> ["red", "yellow", "orange", "pink"]`
- `>>> ["red", "yellow", "orange", "pink"]`

6 Recursion and Dictionaries

7 Testing, Debugging, Exceptions, and Assertions
